

# Assignment 06

## Graphics and Applets

*Due before class on June 16 (Monday)*

Submit a single PDF document containing:

- the source code for each problem
- a screen-shot showing each program running.
- another screen-shot showing the result of running Checkstyle on your code. Make sure you have set the Checkstyle configuration file to cs1705\_checks.xml. Make sure you correct any Checkstyle errors before doing the screen-shot.

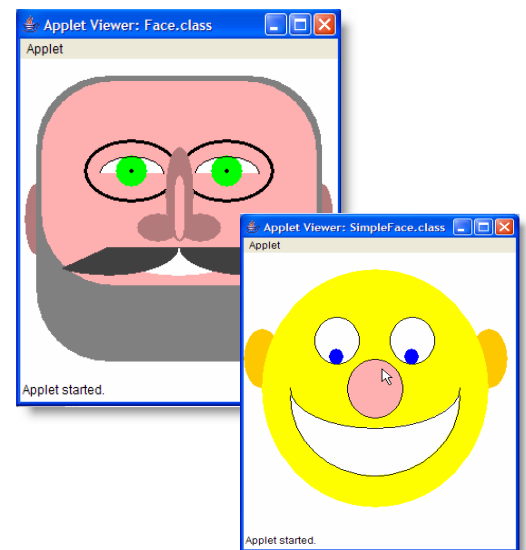

Name your document **LastFirst\_hw06.pdf** and drop it in my submissions folder on the Q: drive.

### Problem 6.1

Using the BlueJ Swing Applet template, write an applet that draws your self-portrait. Give your face eyes with pupils, ears, a nose, and a mouth. Use at least three different colors, and fill in some of the features.

Here's an example of my applet as well as one of your fellow students:

- You may want to switch from JApplet to Applet, like we did in class. If you do that, then add the import statement:  
`import java.applet.*;`
- In addition to the methods for drawing ovals, you might want to look at the `drawArc` and `fillArc` methods.

### Problem 6.2

Using the *TwoCards* program that we created in class as a starting point, use the ACM Graphics classes to create a program, *FiveCards.java* that deals five cards face up when run. You can choose any five cards you like. The cards can overlap each other, but should be arranged attractively. After each card is displayed, use the statement `pause(250);` to cause a short delay before displaying the next card.
