

Assignment 08

Implementing Classes

Due before class on June 19 (Thursday)

Complete problems P3.4, P3.6, and P3.10 at the end of Chapter 3. These problems are very similar to those that you'll have to write for the first Midterm exam.

First, write the classes **Employee** and **EmployeeTest** (*not* Tester as in your book). This is Exercise P3.4 on page 126 in your textbook (or in the Programming Exercises at the end of Chapter 3 if you are using WileyPlus.) Start with the **Completely Blank File** template in BlueJ and then follow the same procedure we used in class to complete the **PongBall** and **PongScore** classes. Your test program should be a JUnit test like the one we wrote for **PongScore**, not a manual unit test like the one we wrote for **PongBall**.

Next, do the same thing for the **Student** and **StudentTest** classes (P3.6) and the **Moth** and **MothTest** classes (P3.10). Each of the test classes should be a separate JUnit test program.

Submit the entire project to Web-Cat before the deadline. You can use the BlueJ Submitter plugin, (like we did in class), or you can just upload the files through the Web interface. To upload the files using your browser, you'll need to zip up both of the files manually; it doesn't matter what you name the zip file. You can submit the homework assignment three times.

This assignment will be graded on a combination of the percentage of passing tests, the portion of your class actually tested by your own tests (called the test coverage percentage), a set of tests that I've designed, and 10% on style. Remember that the Web-Cat scoring is set to 50 points, which will be scaled down to 5 points.
